# Lab 02 — Translate a Finance Requirement into an SGX Price Tool

Python Programming for Finance · TGS-2026065049 · LO1

## Scenario

A wealth desk wants a repeatable daily price summary for a small basket of Singapore-listed equities.

## Goal

A requirement canvas, acceptance tests and an offline-safe SGX price summary script.

## Tools

Python, CSV, optional yfinance

## Step-by-step

**1.** Read scenario.md and identify users, inputs, rules, outputs and risks.

**2.** Complete requirement_canvas.md before coding.

**3.** Run the starter against the supplied fallback prices.

```
python starter.py
```

**4.** Implement load_prices() and format_report() in solution.py.

**5.** Add a test for the invalid ticker row.

```
python -m unittest test_solution.py
```

**6.** Save the output as evidence.txt.

```
python solution.py > evidence.txt
```

## Acceptance criteria

The report prints five labelled SGX prices to two decimals, handles an invalid ticker without crashing, and all tests pass.

## Evidence

Capture the executed output, validation result, generated file or chart, and a one-sentence finance interpretation.
