Lab 13 — Visualize Daily Returns and Distribution

Python Programming for Finance · TGS-2026065049 · LO6 / A4 / A5

Scenario

An investment committee wants to understand daily price changes and the distribution of returns for DBS.

Goal

A return series, line chart and histogram with labelled analytical takeaways.

Tools

Pandas, Matplotlib, CSV

Step-by-step

1. Load dbs_prices.csv and sort by Date.

2. Calculate Close.pct_change() as Daily_Return.

3. Drop the first expected NaN from chart input.

```
python starter.py
```

4. Plot daily returns through time with a zero line.

5. Plot a histogram with mean and tail markers.

```
python solution.py
```

6. Record mean, standard deviation and largest absolute return.

Acceptance criteria

returns.csv has one fewer non-null row than prices; charts render; summary statistics match Pandas calculations.

Evidence

Capture the executed output, validation result, generated file or chart, and a one-sentence finance interpretation.
